

DIGIVOTE

Secure and Intelligent Online Voting Platform

Comprehensive Website User Guide for the DigiVote AI Assistant

Purpose

This PDF is a user-help knowledge source for the DigiVote AI Assistant. It focuses on what a person can do on the DigiVote website and how to complete the website workflows for registration, login, verification, elections, voting, results, security, and election creation/management.

AI answering rule

When a user asks how to perform an action in DigiVote, answer with the website workflow described in this guide. Do not invent screens, buttons, identity documents, verification steps, or timings that are not described here.

Source basis: First Review PPT + current DigiVote website workflow

1. How This Knowledge Base Should Be Used

The DigiVote AI Assistant is intended primarily as a website-help assistant. Its most useful answers explain how to use DigiVote, what page or section to open next, what information is required, what happens after each step, and what common errors mean.

1.1 Question types the assistant should answer

- How do I register on DigiVote?
- How do I login?
- How do I verify my email?
- How do I complete OTP verification?
- How do I use Google login?
- How do I find an election?
- How do I check whether I can vote?
- How do I complete voter verification?
- How do I put/cast my vote?
- What happens after I submit my vote?
- How do I view election results?
- How do I create an election?
- How do I add candidates?
- How do I upload the eligible voter list?
- How do I manage or control my election?
- How do I see or revoke active sessions?
- Why is my login or OTP not working?

Typical answer style

Prefer step-by-step instructions. Mention the relevant page or section name, explain the purpose of the step, and stop before claiming an implementation detail that is not documented. For election-specific eligibility or status questions, the live application database is the authoritative source.

1.2 What this guide is NOT

- It is not a general project-presentation document.
- It is not a replacement for live application data.
- It does not authorize the AI to cast votes, change elections, or bypass security.
- It does not include Aadhaar, DigiLocker, Voter ID linking, or biometric enrollment screens as part of the user-facing flow.

2. Account and Authentication

DigiVote uses one account for the platform. The same user account can be used to create or manage elections the user owns and to vote in another election when the user is included in that election's eligible voter list.

2.1 Registration

The Register page is used to create a DigiVote account. The project specification identifies full name, email, mobile number, and password as registration information. A new account starts in a pending email-verification state.

Step-by-step

1. Open the DigiVote Register page.
2. Enter your full name.
3. Enter your email address.
4. Enter your mobile number.
5. Create a strong password and confirm it.
6. Submit the registration form.
7. Complete the email-verification step before using the account as an active account.

2.2 Login

The Login page is the normal entry point for an existing user. The project specification describes email + password as the primary factor, followed by OTP/MFA before a secure session is created.

8. Open Login.
9. Enter your registered email and password.
10. Submit the login form.
11. Complete the OTP/MFA step when requested.
12. After successful verification, continue to the DigiVote dashboard.

2.3 Google authentication

DigiVote also supports Google OAuth. The project specification states that the backend validates the Google identity and can link an existing DigiVote account. The Google password is not stored by DigiVote.

13. Open Login or the supported Google sign-in entry point.
14. Choose Continue with Google.
15. Complete the Google sign-in and consent flow.
16. Allow DigiVote to complete backend-side Google identity validation.
17. Continue to the DigiVote account once the authentication flow finishes.

2.4 Email verification

- Registration triggers a verification email.
- Open the verification link from the email.
- The verification token is time-limited and single-use.
- When verification succeeds, the account email_verified state is updated.
- Use the resend option if the email did not arrive; follow the cooldown shown by the application.

2.5 OTP authentication / MFA

- DigiVote uses a 6-digit OTP as an additional authentication factor.
- The OTP is generated for the authentication session and is time-limited.
- The system limits attempts and resend frequency to reduce abuse.
- OTP verification completes authentication before a secure session is created.

3. Sessions and Security

3.1 Session management

After successful authentication, DigiVote creates a secure session. The project specification describes device/session visibility, session expiry, selective logout, and full logout/revocation.

18. Open Sessions & Security from the authenticated area.
19. Review the active sessions/devices shown by the application.
20. Use the current-device logout option to end the current session.
21. Use the revoke-all option when you want to end other active sessions as well.
22. Expired sessions should no longer be treated as active by the system.

3.2 Security protections

- Login rate limiting helps restrict repeated failed attempts.
- Failed login activity is monitored for suspicious behavior.
- Accounts can be locked or suspended when suspicious behavior is detected.
- Passwords are stored using secure cryptographic hashing rather than plaintext.
- Authentication and suspicious events are audit logged.

Security answer rule

The AI Assistant can explain security features and normal recovery steps, but it must never provide instructions for bypassing OTP, face verification, session controls, password protections, or election restrictions.

3.3 Common account problems

User question	Safe website guidance
I cannot login	Check email/password, account status, and whether the next OTP/MFA step is required. Do not assume the account is locked unless the application says so.
I did not receive email verification	Use the resend option after the cooldown and confirm the email address.
My OTP expired	Request a new OTP using the application's resend option and enter it before it expires.
My session ended	Sign in again and complete the authentication steps.
I see an unexpected active session	Review Sessions & Security and revoke the session/all sessions as appropriate.

4. Finding an Election and Checking Eligibility

4.1 Available Elections

An authenticated user can use Available Elections to find elections they may participate in. Selecting an election opens its relevant details and allows the user to continue into eligibility and verification.

23. Sign in to DigiVote.
24. Open Available Elections.
25. Choose the election you want to participate in.
26. Review the election information, schedule, and available actions shown by the application.
27. Continue to the eligibility or verification step.

4.2 Election-specific eligibility

Eligibility is election-specific. A person is allowed to vote only when they are included in the eligible voter list configured for that election.

28. Open the selected election.
29. Start the eligibility check.
30. Enter the requested voter details exactly as required by the form.
31. DigiVote matches the submitted details against the eligible voter record for that election.
32. If the record matches and the election is available, continue to verification.
33. If no valid match is found, follow the website correction/help message rather than attempting to bypass the check.

Important

The AI may explain what eligibility means, but a live answer such as "Am I eligible for Election A?" must come from the application database for the authenticated user and the selected election.

4.3 Election information

An election can include its title, description, type, schedule, rules, candidates, voter configuration, and verification settings. The exact fields and available actions depend on the election configuration presented by DigiVote.

5. Voter Verification

The Voter Verification module is used to confirm that the person is eligible and has completed the verification requirements configured for the selected election. The project specification includes voter eligibility validation, email OTP verification, webcam/biometric verification, and one-time voting authorization.

5.1 Verification workflow

34. Start verification from the selected election.
35. Complete the eligibility check against the election's configured eligible voter list.
36. Complete email OTP verification when required by the election.
37. Complete webcam/biometric face verification when that election has it enabled. The biometric/webcam step is a verification action, not a separate biometric-enrollment page.
38. Wait for the application to confirm successful verification.
39. Receive one-time voting authorization when all required checks succeed.
40. Continue to the Voting Booth using the authorized flow.

5.2 If verification fails

Situation	What the website-help assistant should explain
Eligibility mismatch	Check the details entered during eligibility checking and follow the website message. Only the configured eligible voter list determines eligibility for that election.
OTP problem	Use the latest OTP, observe the expiry/cooldown, and request a new OTP when allowed.
Webcam/face verification problem	Check camera permission, lighting, and positioning if the website provides those instructions. Do not attempt to bypass verification.
Already verified	Continue to the next permitted step; do not repeat verification unless the application asks for it.

Scope boundary

The current DigiVote website flow does not ask users to create biometric profiles or complete Aadhaar, DigiLocker, or Voter ID linking screens. Biometric/webcam capability is used only as part of the configured verification process.

6. Creating an Election

DigiVote uses a unified account model. A user who owns an election can create and manage that election from the authenticated dashboard. There is no separate creator login.

6.1 Election creation workflow

41. Sign in to DigiVote.
42. Open My Elections from the dashboard/navigation.
43. Choose Create Election.
44. Enter the election details and choose the election type/configuration.
45. Configure the candidates who will participate.
46. Upload or configure the eligible voter list for this election.
47. Configure the verification options required for the election.
48. Set the election schedule and rules.
49. Review the complete configuration.
50. Publish or schedule the election according to the available website action.

6.2 What the creator configures

Area	Typical task
Election details	Set title, description, type, and other election information.
Candidates	Add candidate information and manage the candidate list for the election.
Eligible voters	Add voters individually or upload the configured voter list/CSV and review validation results.
Verification	Choose the verification mechanisms required for voters in the election.
Schedule and rules	Configure when the election can be accessed and the rules shown to participants.
Review and publish	Check the configuration before making the election available.

6.3 Eligible voter file handling

The election creator can upload the voter list for an election. The website should validate required fields and reject or flag malformed, missing, duplicate, or invalid entries according to the implemented importer. Voters should not be given access to the complete roster.

7. Managing an Election

After creation, the election owner can manage the election through the My Elections area or the election workspace. The project specification includes voter/candidate management, start/stop control, configuration locking after the election starts, monitoring, and audit logs.

7.1 Election management workflow

51. Open My Elections.
52. Select an election you own.
53. Open its election workspace/management view.
54. Review candidates, eligible voter configuration, schedule, rules, and verification settings.
55. Use the available start, stop, pause, or completion controls supported by the implementation.
56. Once an election has started, configuration changes that are locked by the system should no longer be editable.
57. Monitor high-level election activity and review audit events where the interface provides them.
58. After the election completes, use the results/report area for final reporting.

7.2 Ownership rule

A user can manage an election only when the backend recognizes the user as the election owner/authorized manager. The AI assistant must never allow a user to infer that simply knowing an election ID grants management access.

7.3 Common creator questions

- How do I create an election?
- How do I add candidates?
- How do I upload voters?
- How do I configure voter verification?
- How do I start my election?
- Can I change the election after it starts?
- Where can I see election monitoring or audit information?

8. Casting a Vote

The Voting module provides secure voting authorization, candidate selection and confirmation, one-time vote submission, and confidential ballot storage. A voter reaches the Voting Booth only after the required eligibility, verification, and authorization steps have been completed.

8.1 "How do I put/cast my vote?" - preferred assistant answer

Example answer

Log in to your DigiVote account and open Available Elections. Select the election you want to participate in. Complete the election-specific eligibility and required verification steps. After DigiVote grants one-time voting authorization, open the Voting Booth, select your candidate, review your choice carefully, and submit the vote. Follow the confirmation shown by the website after successful submission.

8.2 Detailed voting workflow

59. Sign in to DigiVote.
60. Open Available Elections and select an active/available election.
61. Complete the eligibility check.
62. Complete the required verification steps.
63. Receive one-time voting authorization.
64. Open the Voting Booth.
65. Review the candidate list and select one candidate according to the website rules.
66. Review the selected choice before final submission.
67. Submit the vote once.
68. Wait for the website confirmation that the submission was accepted.
69. Do not submit again unless the website explicitly tells you that the previous attempt failed.

8.3 One-time voting rule

DigiVote is designed so that an authorized voter can submit the vote only once for an election. The voting backend should prevent duplicate submissions, and the user interface should communicate the final nature of the submission clearly.

8.4 What the AI must not do

- Cast a vote on behalf of the user.
- Choose a candidate for the user.
- Recommend or rank candidates.
- Reveal confidential ballots or another voter's vote.
- Bypass eligibility, verification, or voting authorization.
- Modify or delete a submitted vote.

9. Results and Reports

The Result & Report module provides automatic vote counting, result generation and publishing, voter participation reports, and candidate/election reports.

9.1 Voter workflow for results

70. Sign in to DigiVote.
71. Open Results & Reports.
72. Select an election for which results are available to your account.
73. Review the published result information presented by the website.

9.2 Creator/report workflow

74. Open the election workspace after the election is completed or results are available.
75. Open Results & Reports.
76. Review automatic vote counts and published results.
77. Use participation, candidate, or election reports when provided.
78. Export a report in the formats supported by the application.

Privacy boundary

Result pages should present the published/aggregated result information allowed by the election. The AI assistant must not infer or reveal an individual voter's confidential vote from result data.

10. Website FAQ - Answer-Ready Knowledge

Question	Answer guidance
How do I register?	Open Register, enter your full name, email, mobile number, password, and confirmation, submit the form, and complete email verification.
How do I login?	Open Login, enter your email and password, submit, and complete OTP/MFA when requested.
How do I login with Google?	Use Continue with Google and complete the Google sign-in flow. DigiVote validates the Google identity on the backend.
How do I verify my email?	Open the verification email sent after registration and use the time-limited verification link. The link is single-use.
How do I enter OTP?	Enter the 6-digit OTP in the authentication flow and follow the expiry and resend limits shown by the application.
How do I find an election?	After signing in, open Available Elections and select the election you want to participate in.
How do I check my eligibility?	Open the election and start the eligibility check. DigiVote verifies the submitted details against that election's eligible voter list.
How do I verify myself before voting?	Complete the election's configured verification steps, which may include email OTP and webcam/biometric face verification.
How do I cast my vote?	Select an available election, complete eligibility and required verification, receive voting authorization, open Voting Booth, select your candidate, review, and submit once.
Can I vote twice?	No. The voting process is designed for one-time vote submission per eligible voter per election.
Can I change my vote after submission?	The AI assistant must not promise that a submitted vote can be changed. The voting process is intended as a one-time submission.
How do I see results?	Open Results & Reports and choose an election for which results are available.
How do I create an election?	Open My Elections, choose Create Election, configure details, candidates, eligible voters, verification, schedule/rules, review, and publish/schedule.
How do I add candidates?	Open the election workspace under My Elections and use the candidate configuration/management area.
How do I upload the voter list?	Open your election configuration and use the eligible voter upload/import area. Review validation results before finalizing the list.
Can I edit an election after it starts?	Some configuration is locked after the election starts. The exact editable fields are determined by the application.
Where can I manage sessions?	Open Sessions & Security from the authenticated DigiVote area to review or revoke active sessions.
Why is my OTP not working?	Use the latest valid OTP, check expiry, respect resend cooldowns, and request a new code when allowed.
Can I ask the AI to vote for me?	No. The AI Assistant only provides information and guidance; voting must be completed through the normal Voting Booth flow.
Can the AI recommend a candidate?	No. The assistant can explain available candidate information but must remain neutral and must not recommend a candidate.

11. Common Website Troubleshooting

Problem	Website-help response
Network error / unable to connect	Check that the DigiVote backend is running/available and that the frontend API configuration points to the correct backend. Retry without inventing a successful result.
401 Unauthorized	The current session/token is missing or expired. Sign in again using the normal DigiVote authentication flow.
403 Forbidden	The current user does not have permission for that election or action. Do not try to bypass the restriction.
404 Not Found	The selected election/resource may not exist or may no longer be available. Return to the relevant list and select a valid item.
Invalid form data	Check required fields and correct the values requested by the website.
Verification blocked	Follow the verification instructions shown by the site. Check camera/email permissions when relevant.
Results not visible	Results may not yet be published or the selected election may not be completed. Check the election status shown by the website.

No guessing rule

When the website does not provide enough information to diagnose the problem, the assistant should ask the user to check the displayed error message or direct them to the relevant DigiVote page. It should not invent an internal cause.

12. AI Assistant Behaviour and Live Context

The AI Assistant combines this website knowledge base with authorized live application context. This lets it answer both general "how do I" questions and certain current-state questions without treating the language model as the source of truth for database facts.

12.1 Knowledge-base questions

- How do I register?
- How do I cast a vote?
- How does OTP verification work?
- How do I create an election?
- What is the Voting Booth?
- Where can I view results?

12.2 Live-data questions

- Am I eligible to vote in this election?
- Is this election currently available?
- Have I already voted?
- What is the status of my election?
- Do I own this election?

Authority rule

For current election, eligibility, authorization, or voting-status questions, the live DigiVote database is authoritative. RAG documentation can explain the process, but it must not override current application state.

12.3 Privacy and safety rules

- Never expose another voter's personal information.
- Never expose confidential ballot contents or another voter's vote.
- Never reveal passwords, API keys, OTPs, tokens, or internal secrets.
- Never provide instructions to bypass security or verification.
- Never cast, edit, or delete a vote through the assistant.
- Never recommend a candidate or attempt to influence voting choices.

12.4 Example AI conversations

Example	Expected behaviour
User: How to put my vote?	Assistant: Log in, open Available Elections, choose the election, complete eligibility and required verification, receive voting authorization, open Voting Booth, select a candidate, review the choice, and submit once.
User: How do I create an election?	Assistant: Open My Elections, choose Create Election, configure election details, candidates, eligible voters, verification, schedule/rules, review, and publish or schedule the election.
User: Am I eligible for Election A?	Assistant: Check your eligibility against Election A in the live DigiVote system. The assistant should use the authenticated user and selected election context rather than guessing from general documentation.
User: Which candidate should I vote for?	Assistant: I can explain available candidate information, but I cannot recommend or choose a candidate for you.
User: Show me all voters in this election.	Assistant: I cannot provide private voter-list information. I can explain how eligible-voter management works for authorized election managers.

13. Complete End-to-End DigiVote Website Workflow

The following flow connects the main website modules from account access through election participation and reporting.

79. 1. User opens DigiVote and chooses Register or Login.
80. 2. New users register and activate their email. Existing users authenticate with email/password or Google OAuth as supported.
81. 3. Login may require the 6-digit OTP/MFA step before the session becomes active.
82. 4. The authenticated user reaches the DigiVote dashboard and can access both election-management and voter functions allowed by the account.
83. 5. A creator opens My Elections and creates/configures an election with details, candidates, eligible voter list, verification settings, schedule, and rules.
84. 6. The election becomes available according to its configured lifecycle/schedule.
85. 7. A voter opens Available Elections and selects the target election.
86. 8. The voter completes the election-specific eligibility check against the configured eligible voter list.
87. 9. The voter completes the verification methods required for that election.
88. 10. Successful verification results in one-time voting authorization.
89. 11. The voter enters the Voting Booth, selects a candidate, reviews the choice, and submits the vote once.
90. 12. DigiVote stores the ballot according to the application's confidential ballot design and prevents duplicate voting.
91. 13. After completion, the system counts votes automatically and makes results/reports available according to the election workflow.
92. 14. Throughout the process, the DigiVote Assistant can explain website procedures and, where authorized, use current election/account context to answer status questions.

One-line flow

Register/Login -> Email/OTP authentication -> Dashboard -> Election selection or creation -> Eligibility check -> Required verification -> One-time voting authorization -> Voting Booth -> Vote submission -> Results/Reports -> AI assistance throughout the website.

14. DigiVote Website Terminology

Term	Meaning in the website
Dashboard	Authenticated home area from which the user can access the main DigiVote modules.
My Elections	Area used by an election owner to create and manage elections they own.
Available Elections	Area used to find elections available for voter participation.
Eligible voter list	The election-specific roster against which voter eligibility is checked.
Voter Verification	The workflow that confirms eligibility and completes configured voter verification checks.
Voting Booth	The page/flow where an authorized voter selects a candidate and submits the vote.
Voting authorization	The one-time permission granted after required eligibility/verification checks succeed.
Results & Reports	Area for published election results and supported participation/candidate/election reports.
Sessions & Security	Area for active session/device controls and security-related account actions.
DigiVote Assistant	The website-help AI assistant that explains DigiVote procedures and can use authorized live context.

15. AI Knowledge Base Guardrails

This document is optimized for retrieval-based website assistance. It intentionally emphasizes task-oriented instructions and answer-ready examples rather than general project-presentation content.

- Prefer exact page/section names used by the website: Register, Login, Available Elections, My Elections, Voter Verification, Voting Booth, Results & Reports, Sessions & Security, and DigiVote Assistant.
- Answer "how to" questions with ordered steps.
- Use the live database for user/election-specific status and eligibility questions.
- Do not expose private voter data or confidential ballot data.
- Do not recommend candidates or make voting choices.
- Do not claim an operation succeeded unless the backend actually reports success.
- Do not invent field names, deadlines, OTP durations, exact screen labels, or error causes when the application does not supply them.
- This guide does not define legal election compliance, real-world governmental policy, or any feature not implemented in DigiVote.

Recommended ingestion use

Ingest this PDF as the primary website-help knowledge source for the AI Assistant. Keep current user/election status in the backend database context so the model can answer procedural questions from the document and state-dependent questions from live application data.

16. Quick Reference for the AI Assistant

If the user asks...	Use this knowledge
How do I register/login/verify OTP?	Account and Authentication sections
How do I find an election/check eligibility?	Available Elections and Eligibility sections
How do I verify myself?	Voter Verification section
How do I put/cast my vote?	Voting section and the preferred example answer
How do I see results?	Results and Reports section
How do I create/manage an election?	Election Creation and Election Management sections
Why is login/OTP/verification failing?	Troubleshooting section
Am I eligible / have I voted / is the election active?	Use live authenticated database context
Which candidate should I choose?	Remain neutral; do not recommend
Show me voter list or vote details?	Protect privacy; do not expose confidential information

End of knowledge document

DigiVote AI Assistant should use this guide to help users complete normal website actions. For current state, eligibility, authorization, and ownership, the backend application remains the source of truth.
